

Can AI Help Humanitarian Teams Turn Crisis Signals Into Action?

Sudan Humanitarian AI Insights

No paid APIs

Synthetic demo data

Human oversight

Created by Shireen El Sabea

Humanitarian teams make decisions under pressure

Displacement changes quickly

Feedback arrives in many formats

Resources are limited

Teams need fast, explainable insight

From scattered signals to decision support

This prototype shows how AI-assisted analysis can organize crisis context, classify feedback, rank hotspots, and generate action briefs.

Sudan Humanitarian AI Insights Dashboard

- Hotspot ranking
- Sector pressure matrix
- Synthetic feedback intelligence
- Trend and scenario view
- AI Action Brief per location

Hotspot ranking

Sector matrix

Transparent AI, not black-box decisions

The prototype uses local NLP-style classification and explainable scoring to support human review.

Message

The water point is broken and children are sick after unsafe water.

Sector: WASH

Urgency: Critical

Action: Field validation

No paid APIs. No PII. No private field data.

The most important output is action

AI Action Brief: South Darfur

- Why it was prioritized
- Top risk drivers
- Suggested next steps
- Field validation needs

IDP volume

Food

WASH

Access

Decision-support note, not automated allocation.

Humanitarian AI must be careful by design

☐ **Privacy first**

☐ **Synthetic demo data**

☐ **Human oversight**

☐ **Explainable scoring**

☐ **Do no harm**

☐ **Field validation before action**

AI should help teams listen better and prioritize faster

This kind of dashboard can help NGOs discuss needs, risks, and tradeoffs with more transparency.

AI supports decisions. It should not replace humanitarian judgment.

Let's build responsible AI for social impact

I am open to collaboration with NGOs, humanitarian data teams, and social-impact organizations working on responsible AI, community feedback, and needs analysis.
